Business Service Database Design

1. Overview

Purpose

The Business Service manages businesses registered on the KevaBook platform and the staff members who work for those businesses.

It is responsible for:

- Creating business profiles
- Updating business information
- Retrieving business details
- Managing business settings
- Managing staff members
- Verifying business ownership

The Business Service does **not** manage:

- User authentication
- Services offered by businesses
- Staff availability schedules
- Bookings
- Notifications

2. Database Technology

Property	Value
Database Type	PostgresSQL
Service	Business service
Primary Aggregate	Business, Staff Member
Table count	2

3. Aggregate

Business

The Business aggregate represents a service provider registered on the KevaBook platform. Examples are tutors, consultants, coaches, therapists, freelancers, beauty professionals, etc...

Staff Member

Represents an employee or service provider who performs one or more services for a business. Examples could be a barber, massage therapist, etc... Each staff member belongs to exactly one business.

4. Ownership Model

Relationship

- User Service owns BusinessOwner
- Business Service stores ownerId only
- No database foreign key exists

5. Table Design

Table Name

businesses

6. Table Structure

Column	Type	Required	Description
businessId	Long	Yes	Business unique identifier
userId	String	Yes	Business owner unique identifier
name	String	Yes	Business name
